DEPARTMENT OF

FACULTY APPRISAL FORM (January 2024 to Dec 2024)

PART – I
BASIC INFORMATION

Staff Name: Dr. Selvamani M Designation: Professor & Head and Vice Principal

Joining Date: 26 June 2014 Experience: In House : 10 yrs 6 Month
Out House : 5 yrs
Total : 15 Yrs 6 Month

Date of Birth : 26 Feb 1981 Age: 43 yrs

Mobile Number : 9480774400

E-Mail : dr.selvamani@mahedentalcollege.org

PART – II
ACADEMIC ACHIEVEMENTS

Contributions towards department and college in any of the following:

1. Add-on/Value added/CDE Contribution:

Add-on/Value added courses conducted/ attended	CDE conducted/ Attended
1. Recent Advances & Role of Artificial Intelligence in OPMDs and Training for Biopsy Techniques	1. Foundation 2.0
2. Value Added Course on Forensic Odontology	2. Exam Mastry
3. Basic Artificial Intelligence Tools for Educators	3. Tooth Sleuths
4. Forensic Odontology: Basic and Beyond	4. Eduverse
5. Academic Writing	5. Beyond Smoke
6. Literature Search & Reference Management in academic Writing	6. Detox
7. Soft Skills The secret key for professional success	7. Samiksha

MAHE INSTITUTE OF DENTAL SCIENCES & HOSPITAL
Affiliated to Pondicherry Central University, Recognized by Dental Council of
India
Chalakkara, P.O. Pallor, Mahe-673 310
U.T. of Puducherry. Ph : 0490 2337765

8. Management fractured & Dislodged Crown	
---	--

2. What actions have you taken for the following (for students) and what were the result?

- Slow Performers** : Conducted Group Discussion
- o Developed personalized education plans that cater to the specific needs and pace of each student
 - o Conduct regular assessments to monitor progress

Advance Learners : Guided them in Article Writing, Participating National Level Quiz Competition

Career Guidance : Counselling for higher studies

Competitive Exam Coaching : Guiding

3. Any Unique Contribution:

Department	College
Planning for getting ICMR Grant for Organizing Scientific event	Planning to get registration for Ethical Committee

4. Leave Record

Casual Leave	SpCL/OD Leave	Loss of Pay	Total Absence

PART – III

ABSTRACT

Candidiasis, primarily caused by *Candida albicans*, poses significant oral health concerns. This review highlights its clinical manifestations, diagnostics, and management strategies. Predisposing factors include poor oral hygiene and systemic conditions like HIV/AIDS and diabetes. Clinical presentation varies from asymptomatic colonization to symptomatic mucosal infections, with complications such as denture stomatitis. Diagnostics encompass clinical examination and various laboratory methods, guiding tailored treatment with topical or systemic antifungals. Prevention strategies targeting modifiable risk factors are crucial. Despite challenges like antifungal resistance, interdisciplinary collaboration among healthcare providers is essential for the effective management of oral candidiasis and its impact on overall health.

Keywords: Candidiasis; *Candida albicans*; Oral health; Diagnostics; Antifungals; Prevention strategies

1 INTRODUCTION

Oral candidiasis, a mycosis primarily caused by the *Candida albicans* poses a health concern as it can affect individuals of all age groups. Other species that can also cause this infection include *Candida krusei*, *Candida glabrata*, *Candida parapsilosis*, *Candida tropicalis*, *Candida dubliniensis*, *Candida kefyr*, *Candida pseudotropicalis*. Culturing methods have identified 20 different genera and 80 species from the samples. Understanding the various facets of this condition, from its causes to its clinical diagnosis and management, is essential for both healthcare professionals and patients alike. The general symptoms experienced include a burning sensation and soreness in the mucosa which occurs due to the damage caused. In addition to this, progressive periodontal diseases and dental caries can be seen due

to additional yeast colonization. Chronic mucocutaneous candidiasis is a type of candidiasis that is often found in connection, with oral cancer. This occurs due to the production of aldehyde⁽¹⁾.

Individuals with compromised systems can serve as a fount for *Candida* infection⁽²⁾. Many local and systemic factors cause *Candidal* infection, the use of dentures, xerostomia, and corticosteroid inhalers are a few local factors while immunosuppressed conditions like infection with human immunodeficiency virus (HIV), malnutrition, diabetic patients, patients undergoing systemic chemotherapy and radiotherapy are few systemic factors. Recent studies have shown that psoriasis is also a factor that causes oral candidiasis⁽³⁾.

The increase in temperature of the oral cavity makes it easier for the pseudohyphal invasion of *Candida*. The

ORIGINAL RESEARCH

Expression of P53 in Oral Squamous Cell Carcinoma – an IHC Study; Deep Insight into P53

Lakshmi P. Das¹, Bastian T.S.², Selvamani M², Manoj S. Nair², Roopan Prakash¹, Karthika PS¹

ABSTRACT

Background: Oral squamous cell carcinoma (OSCC) entails quite noteworthy morbidity and mortality rates instead of immense amount of research and advances. Mutation in the TP53 gene is the most common genetic change found in oral squamous cell carcinoma (OSCC). Once activated, the p53 protein can induce the growth arrest, as well as cell death. Mutation and subsequent inactivation of a tumor suppressor gene causes 'loss of function'. This can damage its deoxyribonucleic acid (DNA) binding properties and transcription factor function, thus, inhibiting its normal function in cell cycle control and in cell proliferation.

Aim: A comparative study of P53 expression in oral squamous cell carcinoma using immunohistochemical techniques.

Materials and Methods: To study the relationship between histological grades of oral squamous cell carcinoma and P53 protein expression and also to compare along with normal mucosa, a total of 40 cases of histologically diagnosed OSCC were considered for the study group and 10 paraffin embedded normal mucosal tissue blocks were collected. The analysis of p53 positive cells was performed on IHC stained sections. Only staining of nucleus of epithelial cells was observed. Nuclei with clear brown colour regardless of staining intensity were considered as p53 positive. Counting of cells was done with graticule eyepiece. All these cases were reviewed and classified according to modified Anneroths histological malignancy grading system.

Results: When p53 expression was compared between the two groups i.e control and study groups. The expression of p53 was nil in normal oral mucosal tissue (control), while study group i.e OSCC expressed about 47.49% with Std.Dev of $\pm 35.83\%$. And it was found to be a statistically significant ($p < 0.001$).

Conclusion: The present study concludes a positive correlation between the histopathological grades of OSCC and immunohistochemistry (p53 expression). Expression of p53 above the basal layer is an early event in oral carcinogenesis and an indicator of a developing carcinoma preceding morphological tissue alterations. However, since immunohistochemistry cannot always detect changes in p53 expression in premalignant/malignant lesions, it is strongly recommended that p53 immunohistochemistry be used in conjugation with routine histology to increase the sensitivity of detection of cases that eventually progress to malignancy.

Keywords: OSCC, IHC, TP53

INTRODUCTION

Cancer is older than humanity S.U. Williston, in early 1920's, found a bone tumor on skeleton of dinosaur in Wyoming¹. Oral cancer includes a group of neoplasms affecting any region of the oral cavity, pharyngeal regions and salivary glands. However this term tends to used interchangeably with oral squamous cell carcinoma (OSCC), which represents most frequent of all oral neoplasms². The quantitative study of P53 suggested their aberrant expression in oral cancer. P53 over expression was also detected in 15-19% of oral-premalignant lesions, including lesions with mild dysplasia in head and neck cancer patients³.

P53 protein was first described by Levine, Crawford, and Lane in 1979. TP53 (tumor protein 53) is a tumor suppressor gene (TSG) which is located on the short arm (p) of chromosome 17. TSGs encode proteins that typically transduce the negative growth regulatory signals. These are involved in cell
